Problem & Opportunity

Card-bound rewards are difficult to see and use, with no easy digital way to tip fuel attendants.

Objectives & Goals

- Design a petrol-retail rewards experience around the real rhythm of a fuel stop, with visible value and flexible redemption.
- Give customers payment freedom and an intentional way to say thank you, without slowing the moment of purchase.

MVP definition & trade-offs

Design
Flow, screens & visual system

Product Challenges

→ Card-bound rewards are difficult to see and use.

→ There is no easy digital way to tip fuel attendants.

→ Payment compatibility with station systems must be validated.

→ Unrestricted cash-out can introduce fraud and financial liability.

→ The fuel stop must stay fast and reliable.

Behavioural Archetypes

Two archetypes built from market patterns: **Lindiwe Sibanda** and **Jabulani Dube**.

Hypotheses to validate, not interview-based personas.

Research Method

An audit of fuel-retail and adjacent high-frequency loyalty models, run as self-directed concept research with a defined scope and clear constraints.

Market audit synthesis

01
Visibility
Can customers see what they have earned, straight away?

02
Usable value
Can points be turned into something useful, easily?

03
Tipping integration
Is there a clear digital way to thank the attendant?

04
Redemption flexibility
Can customers choose when and where to redeem?

User Needs

Both archetypes point to one shared need: **control**.

→ Control over which payment method is used.

→ Control over where value can be redeemed.

→ Control over how generosity is expressed.

The MVP should remove the constraints that take that control away.

MVP Definition

Four behaviours, four hypotheses to validate first

See it
Visibility: balance and value are clear straight away.

Use it now
Cash-out and redemption on the customer's terms.

Pay my way
Card-agnostic earning, whichever method is used.

Thank clearly
Optional digital tipping for attendants.

Product Thinking & Trade-offs

Flexibility matters, but the fuel stop must stay fast.

→ **Card-agnostic earning (flexibility vs. simplicity).** More payment methods remove friction but add reconciliation and integration complexity. Prioritise a clear earning flow and validate payment compatibility with station systems before expanding.

→ **Use rewards now (redemption vs. value control).** Immediate redemption makes points feel useful, while unrestricted cash-out can introduce fraud and financial liability. Start with transparent balances and defined redemption rules.

→ **Digital tipping (generosity vs. checkout friction).** Tipping adds a human layer but must not slow payment. Keep it optional, quick and clearly confirmed, with the amount and recipient visible.

→ **Four core behaviours (feature breadth vs. adoption).** Focus on seeing rewards, using them, paying with flexibility and thanking an attendant. Defer advanced features until station pilots show they work.

MVP principle: preserve customer choice without adding steps to the moment of purchase.

Competitor Analysis

Three fuel-retail loyalty offers compared across payment compatibility, redemption and digital tipping.

Sasol Rewards
Loyalty programme

BP Rewards
Loyalty programme

Engen 1App
Loyalty app

Compared on Payment compatibility · Redemption · Digital tipping

Design Decisions

→ One unified balance, not separate wallets.

→ Real-time visibility and control over point usage.

→ Preserve customer freedom with card-agnostic earning.

→ Bring the human service layer into the ecosystem through explicit tipping.

User Archetypes

Lindiwe Sibanda
Balance- and value-conscious parent

Description
A hypothesis archetype based on market patterns, not user interviews. In the fuel-stop journey below, she wants the stop to be quick and straightforward, with the value of loyalty easy to see.

Shared need: **control** over the payment method, where value can be redeemed and how generosity is expressed.

Jabulani Dube
Regular, generous loyalist

Description
A hypothesis archetype based on market patterns, not user interviews: a regular, generous loyalist.

Shared need: **control** over the payment method, where value can be redeemed and how generosity is expressed.

One Fuel Stop, A Smoother Rewards Experience

Following Lindiwe through a familiar visit, from pulling into the garage to thanking the attendant.

Step	Moment	What happens	Cue
1	**Arriving at the garage**	Lindiwe pulls in and chooses a pump, wanting the stop to be quick and straightforward.	Fuel stop
2	**Choosing how to pay**	She checks her available payment options and chooses the method that suits her.	Payment choice
3	**Fuel and earn**	The attendant fuels the car. The visit earns rewards without adding another task.	Rewards earned
4	**See the value**	Her balance is visible straight away, making the value of loyalty easier to understand.	+250 points earned
5	**Choose a reward**	She can decide when and where to use her points, instead of being locked into one option.	Redeem
6	**Thank the attendant**	Before leaving, she adds an optional digital tip. A small gesture makes the service feel human.	Thank you

Core MVP Success Matrix

Primary measure
Repeat engagement

Supporting signal
Sign-up

Supporting signal
Redemption

Proposed success measures require customer, commercial and station-operations validation.

Digital Flow

The digital flow mirrors the physical station journey.

Launch → Sign-in → Dashboard → Fuel payment

Rewards → Tipping → Wallet

Low-fidelity Exploration

Low-fidelity screens explore the core tasks before the visual design is applied: attendant identification, payment, rewards, withdrawal and redemption.

Low-fidelity screens
Add the exported frames from the Velocity case study here

High-fidelity UI

The interface brings balance visibility, redemption, payment freedom and digital tipping into one experience: rewards, redemption, pay it forward tipping, attendant scanning and withdrawal.

High-fidelity screens

Next Steps

The next test belongs at the station: research and pilot activities to validate the concept with customers, the business and station operations.

Scope and evidence. This is a self-directed concept informed by a competitor and market audit. The archetypes are hypotheses, not interview-based personas. The concept and proposed success measures require customer, commercial and station-operations validation.
